## Summary

BIII 277CL is a highly potent and selective antagonist of the NMDA receptor ( $K_i$  4.5 nM) that can be used to test biological hypotheses.

## Chemical Structure

Figure 1: 2-D structure of BIII 277CL

Figure 2: 3-D structure of BIII 277CL

## Highlights

BIII 277CL is a selective high affinity blocker of the NMDA receptor ion channel ( $K_i = 4.5$  nM). This molecule is available for both *in vitro* and *in vivo* experiments. In mice, it showed significant neuroprotective effects. BIII 277CL showed dose-dependent reduction of the cortical infarct area in mice with focal cerebral ischemia and also prevented NMDA-induced lethality.

## Target information

The NMDA receptor is a subtype of excitatory amino acid receptor found in nerve cells, which allows cationic influx upon activation by glutamate and glycine.

Structurally, the NMDA receptor–channel complex consists of a voltage-dependent  $\text{Na}^+/\text{Ca}^{2+}$  channel and at least 3 different regulatory domains: neurotransmitter recognition site (glutamate, aspartate, or NMDA binding site), strychnine-insensitive glycine site, and ion channel itself (can be blocked by  $\text{Mg}^{2+}$  or other blockers).

During ischemia, large amounts of glutamate and aspartate (excitatory neurotransmitters) are released into the extracellular space, which can lead to neuronal deaths. This implicates the NMDA receptor–channel complex with pathophysiology of numerous neurological disorders, such as stroke, epilepsy, Alzheimer’s disease, ALS, and others.

BIII 277CL is a high affinity blocker of the NMDA receptor ion channel with specificity over other binding sites of the NMDA receptor–channel complex. In addition, BIII 277CL did not exhibit significant affinities for other central neurotransmitter receptors.

BIII 277CL also antagonized NMDA-induced  $[^3\text{H}]$ noradrenaline release and NMDA-induced inhibition of protein synthesis in rat hippocampal slices.

## *In vitro* activity

BIII 277CL is a high affinity blocker of the NMDA receptor ion channel ( $K_i = 4.5$  nM; [ $^3$ H]MK-801 displacement assay in rat brain synaptosomal membrane) with specificity over other binding sites of the NMDA receptor–channel complex (glycine and NMDA binding sites). In addition, BIII 277CL did not exhibit significant affinities for other central neurotransmitter receptors.

<sup>b</sup>dose [mg/kg]

## ***In vivo* pharmacology**

In mice, BIII 277CL showed significant neuroprotective effects. The title compound prevented NMDA-induced lethality and caused disturbances in motor coordination ( $ID_{50} = 0.54$  mg/kg s.c. and  $ED_{50} = 0.47$  mg/kg s.c., respectively).

Furthermore, intraperitoneal or subcutaneous application of BIII 277CL to mice dose-dependently reduced the cortical infarct area from focal cerebral ischemia by unilateral occlusion of the middle cerebral artery.

## **Negative control**

In addition, we offer a structurally closely related BI-25CL, which showed no marked affinity at the NMDA receptor ion channel ( $K_i = 50$   $\mu$ M; [ $^3$ H] MK-801 displacement assay in rat brain synaptosomal membrane) to be used as a control compound in *in vitro* studies.

**Figure 4:** BI-25CL which serves as a negative control

## **Selectivity**

BIII 277CL displayed only weak affinities for  $\sigma$ - and  $\mu$ -opiate binding sites ([ $^3$ H]DTG, [ $^3$ H]dihydromorphine, [ $^3$ H]naloxone displacement assays in rat brain synaptosomal membrane) and 200-fold selectivity toward the channel site of the NMDA receptor-channel complex with no marked affinities up to 10  $\mu$ M for the glycine site and the NMDA binding site of the NMDA receptor-channel complex.

Additionally, BIII 277CL did not exhibit affinities up to 100  $\mu$ M for the dopamine  $D_1$  and  $D_2$  receptors ([ $^3$ H]SCH 23390 and [ $^3$ H]spiroperidol displacement assay).
